

## Thoughts

First of all, thanks for your lecture and your kind introduction. With a bachelor background of automotive engineering, getting more knowledge related is the main motivation for me to choose this course. And I have to say that I learn a lot. Your brief but broad introduction gives me a chance to access to various motors, not only the one used as the prime mover of electronic vehicles but also those for some other machines like medical instruments, and to gain an understanding of their mechanical theory, advantages/disadvantages and the application, which I do believe these knowledge will be helpful when I need to choose a suitable motors. Besides, I would like to show my respect to those engineers you show in a documentary because of their stories and efforts behind the development of CVT, even though I cannot fully understand all the Japanese words they say.
